## SPECIAL INSTRUCTIONS FOR FALL PLANTING

FALL PLANTING is very successful and more of it is being done every year.

TREES planted in the fall receive the benefit of the cool, moist weather during which to become established instead of being followed by a hot dry summer as is so often the case with spring planted stock.

HOWEVER,-there are a few precautions which should be taken when planting in the fall in order to insure 100% success.

FIRST,-remember trees like to go into the winter with "WET FEET" After the ground freezes, there is no more opportunity for the soil to take up additional moisture, so be sure to keep the ground well soaked until it freezes, unless rain is plentiful.

SECOND,-as soon as the ground freezes mulch the ground around the trees, or cover them completely if they are small seedlings, with either marsh hay, straw or leaves, but if you do cover the entire tree, be sure not to put it on too thick and thereby smother them. The purpose of the mulch is to help retain the moisture in the soil and to prevent heaving in the spring from alternate freezing and thawing.

REMEMBER,-water your trees well until the ground freezes, unless it rains a lot, then mulch with straw, leaves or hay, and you will be delighted with how fresh and nice they will be next spring, and you will be astounded at the growth they will make the first year.

OUR EXPERIENCE,-has been that all Spruce, Pine and Fir varieties transplant very well anytime after September 1st, while all Juniper, Arbor Vitae and Taxus are best planted a little later, beginning the later part of September or forepart of October, and of course deciduous items after they have become dormant, indicated by their loss of leaves.
